

Quark Bot basic documentation

Tor-Haakon Gjone

January 30, 2019

Command list:

help to show this message

pause: temporarily pause the bot.

unpause: to enable the bot if paused.

define: define shortcuts.

undefine to delete a shortcut.

getdefines to list the defined shortcuts.

Use ”

help

;command;” for more info.

1 latex

You can now add LaTeX code on your messages! Just type

latex before the code you would like to send and I will take care of the rest. For example, if you write

” Euler ’s identity $\backslash\text{latex } e^{\{i\pi\}} + 1 = 0$ ”

”, I will send: ::newmessage Euler’s identity ::attachment(res/eulers.png)

2 define

You can define shortcuts for frequently used code for simplicity. Just write

define shortcut code. If you desire to delete this shortcut, simply write

undefine shortcut. If you use any of these commands on a group chat that includes me, all members of the chat will have access to the shortcuts and they will only be available within that group. However, if you would like to restrict the shortcuts for yourself, you can use the

define commands on your private chat with me. Then, you will also be able to use your shortcuts on any chat that I am included in.

subsection*defaults Use ”

getDefaultDefines”, to get a list of all the defines that are always defined. However you may override them if you wish.

pause

Use ”

pause” to temporarily pause me. Use ”

unpause” to enable me again.
